

Provide availability in the event  
of system failures and attacks

On-Premises. Hybrid. Cloud.

# Libelle *BusinessShadow*

Reacting to infrastructural, technical, logical and external influences.

Combination of  
RPO, RTO and  
RCO

Time-delayed  
mirroring to respond  
to logical errors

Infrastructure  
Independent

Georedundancy

„Thanks to **BusinessShadow**, we significantly increased our protection against disaster incident“ [Christian Schreiner, Hubtex]

## Data Mirroring in SAP<sup>®</sup>, Non-SAP or heterogeneous Application Environments - Libelle **BusinessShadow**

In the course of digitalization, data must be permanently available more than ever. The requirements for Recovery Time, Recovery Point and Recovery Consistency Objectives are increasing. Intelligent and consistent mirroring concepts for databases and entire application environments are the answer. Therefore, solutions are required that enable the IT landscape to be mirrored in its entirety, such as Libelle **BusinessShadow**.

### What do users appreciate most?

#### Automation of even complex DR scenarios with just the push of a button

Integration of switching operations for databases, file systems, IP addresses, host names, etc. for both individual systems and system landscapes. Reduce complex processes to the proverbial push of a button.

#### Restart automation

After switching the above components, the restart automation also enables the start-up of specific application components in the desired order, if required.

#### Reaction to all kind of error types

Some incidents aim to a restore with the last known data status. Others, e.g. data corruption, data deletions and ransomware attacks, require to switch back to an earlier point in time.

#### Independence of architectures, infrastructures and distances.

Whether campus, DR data center or cloud, whether stand-alone or cluster, whether DASD or SAN: The mirror system is only few clicks away.
